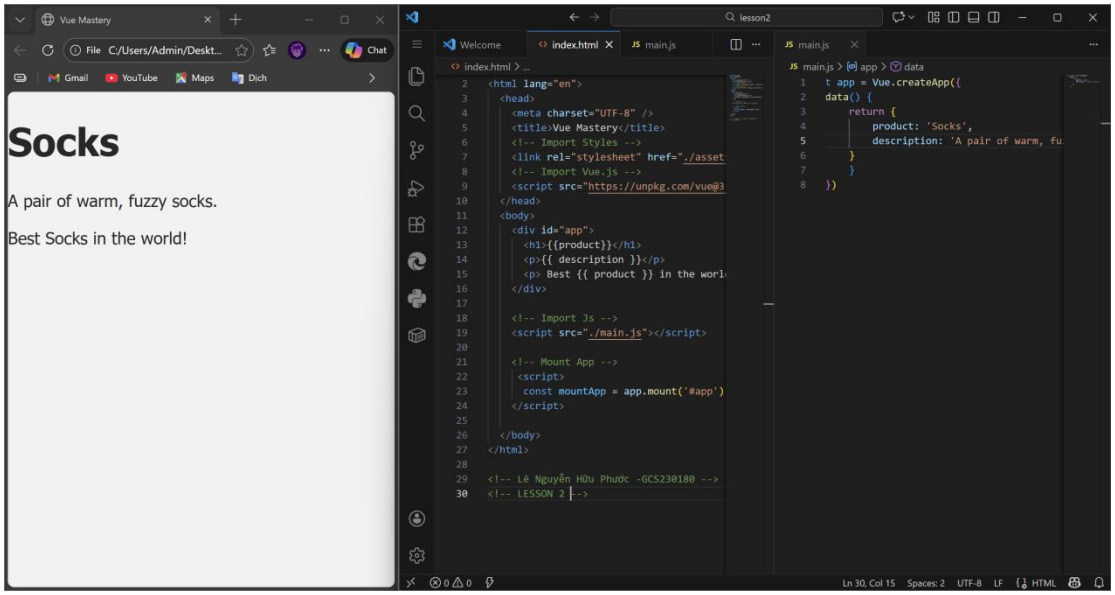
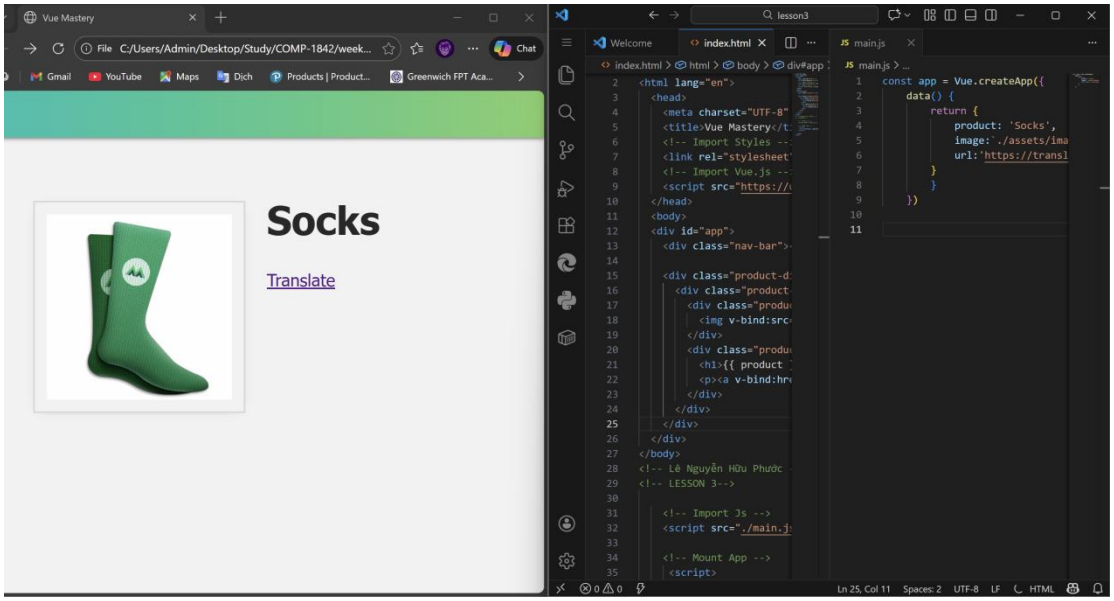
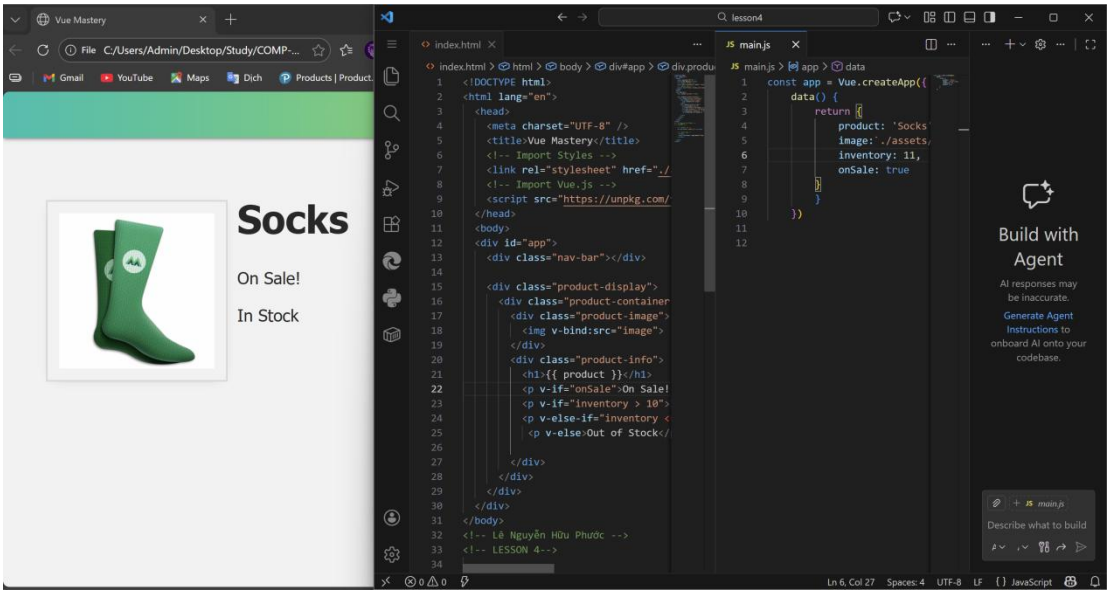
Name: Lê Nguyễn Hữu Phước -GCS230180-



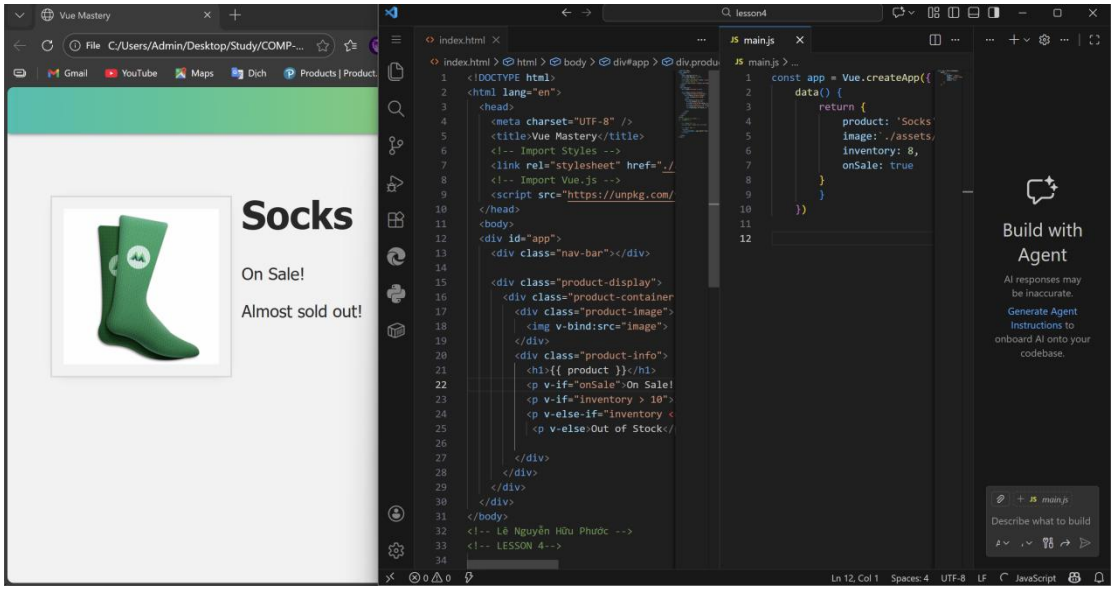
Lesson 2



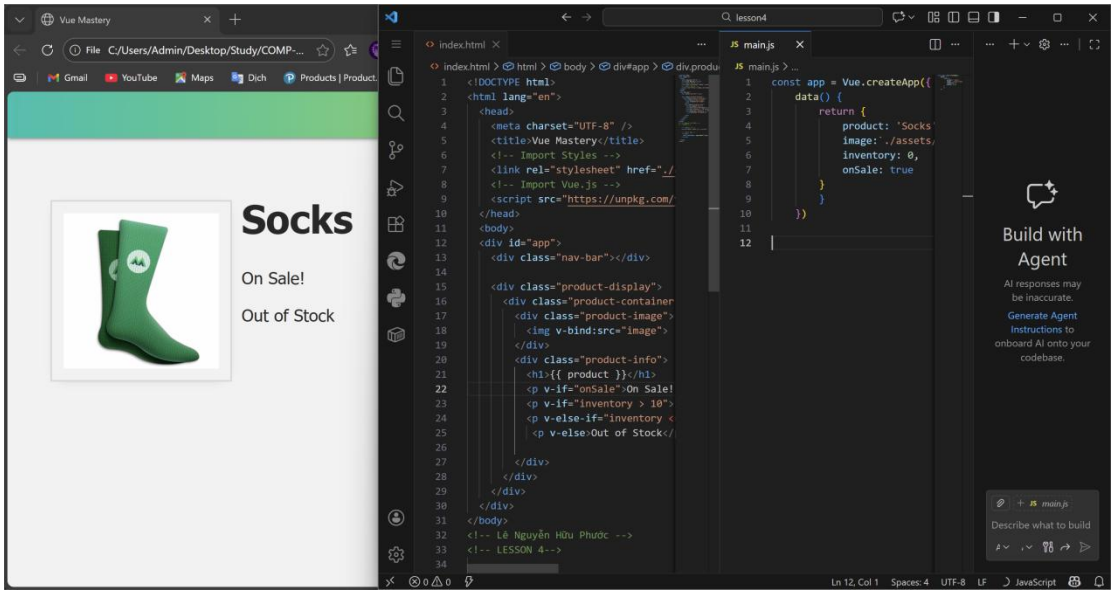
Lesson 3



Lesson 4: When inventory more than 10



Lesson 4: When inventory less than 10



Lesson 4: When inventory equals 0

Understanding

The Week 1 Lab focuses on transitioning from manual DOM manipulation to the declarative power of **Vue 3**. By following the first four lessons of the "Intro to Vue 3" course, we establish a foundational understanding of how modern frameworks handle data and user interfaces.

The core of the lab involves creating a **Vue Instance** using createApp(), where the application's state is centrally managed within a data() function. We learn to bridge the gap between JavaScript and HTML using **Mustache Syntax** ({{ }}) for text interpolation and **Attribute Binding** (v-bind or :) for dynamically updating elements like images and links. Furthermore, the lab introduces **Conditional Rendering**, where directives such as v-if, v-else, and v-show allow the interface to respond intelligently to data changes—such as toggling visibility based on inventory levels.

Beyond technical implementation, the lab emphasizes structured project management and academic integrity. Each task must be organized into specific subfolders (lesson2, lesson3, and lesson4) and documented in a logbook PDF. These records must include annotated screenshots of the browser output, clearly displaying a personal identifier (name or ID) to prove authorship. Ultimately, this lab provides the essential skills in **reactivity** and **directives** necessary for building scalable, interactive web applications.
